D4p1

1
00:00:02,460 --> 00:00:04,540
[Interviewer]: Okay, how did you proceed with the first task?

2
00:00:07,320 --> 00:00:29,600
[Participant]: The first task before that one you mean? I first of all tried to get the pose right and then I've continued with setting up the shot. But for me it was important to perfectly set up the figure so that it resembles a realistic running pose.

3
00:00:35,120 --> 00:00:36,420
[Interviewer]: And for the second task?

4
00:00:36,600 --> 00:01:21,340
[Participant]: I think it was kind of the same because a backflip is quite a complex movement and therefore I thought I should get every stage right from the beginning of preparing the jump to jumping up until the flip. But it was more difficult to the pose and think about how it would look in real life and therefore I wasted quite a bit of time with over complicating the movement and putting less focus on the background which suffered a bit in the last frame.

5
00:01:21,420 --> 00:01:47,160
[Interviewer]: Okay, thank you. Did you first think of every frame you wanted to make or went like with the flow like step by step just posing or did you already know how it would look beforehand?

6
00:01:47,220 --> 00:02:17,900
[Participant]: I would say kind of in between. With the backflip one. I did want to separate it into preparing the jump, the actual jumping and then two or three more shots for the actual flip. So I had a rough plan but during the process I realized I could need one or more frames so that one can see that an actual flip is happening and not just jumping and pulling up your knees to your chest.

7
00:02:17,940 --> 00:02:38,980
[Interviewer]: Um On a scale from one to seven um with one being the most negative and seven positive. how did you like the physical posing feature?

8

00:02:42,080 --> 00:03:25,040
[Participant]: I would put it on a five to six. More on the high end. The only problems were that it was sometimes kind of difficult to set up the figure and get the exact pose and keep the figure in that exact pose which at some points didnt work out as much as i wanted it to but when it worked out it was pretty great because you could move so many intricate parts that. you could more than I realized at the beginning get quite intricate poses that are quite nice to do especially for a storyboard in my opinion because you have such an intricate view of how the movement should look and not just a rough sketch.

9
00:03:30,000 --> 00:03:42,400
[Interviewer]: Were there moment where the manikin changed your original idea?

10
00:03:42,500 --> 00:03:44,880
[Participant]: Could you clarify that question?

11
00:03:44,980 --> 00:03:57,300
[Interviewer]: Like you had an idea in your head and did the manikin change that idea somehow like you said already because it was a little hard to move that it changed a bit. Was there anything else?

12
00:03:57,340 --> 00:04:31,820
[Participant]: I would say so, yes. In the first task I had some problems with aligning the back leg so that it looked realistically as if it was in a running motion and with the backflip one I did have quite some difficulties to get the pose with his knees to his chest because I wanted him to be pretty tight and closed up and kind of like bunched up into a ball. but it didn't work out that much and I couldn't compress the figure as much as I wanted it to.

13
00:04:33,460 --> 00:04:41,940
[Interviewer]: Okay and in the first one you said with the back leg was it because the mannequin couldn't do that or because you didn't know how to?

14
00:04:43,220 --> 00:05:18,980
[Participant]: I think a bit of both. At first I did have some difficulties with getting the exact pose because I was kind of afraid to break the figure. Because it had so many parts and some were a bit more loose than the others. and yeah I think with the with the upper leg part it sometimes was quite difficult to get the full range of motion that I was expecting from a human and sometimes the figure couldn't actually achieve it as much as I wanted it to.

15
00:05:21,200 --> 00:05:28,080
[Interviewer]: On a scale from one to seven how much did you feel in control of the results?

16
00:05:33,560 --> 00:06:30,080
[Participant]: Five. The more I got into the figure the easier it was to control and maneuver it but I did have some difficulties with the backgrounds at some points because I did want to put some prompts into a higher importance than others and sometimes it was a bit difficult to handle and therefore the AI put the focus on places I didn't want the focus to be in. And there were some problems with the head of the figure where the AI sometimes thought that the mannequin was looking at the camera but he was like looking straight forward.

17
00:06:38,140 --> 00:06:57,360
[Interviewer]: And um You generated a lot of images. Was it because you weren't happy with the ones generated or did you want to see what else would come out or?

18
00:06:57,400 --> 00:07:33,240
[Participant]: I wasn't always satisfied with the backgrounds that were generated. Sometimes they were a bit too rough or not… they didn't look that much like a city as I wanted to and I did use the time to generate more frames while I was prepping up the mannequin for the next scene So that I would just have more choices to choose from and use up the time that otherwise would be wasted.

19
00:07:38,120 --> 00:07:42,540
[Interviewer]: And how did the mannequin influence your feeling of control over the result?

20
00:07:44,400 --> 00:08:43,100
[Participant]: It did give me quite a feeling of control because of that there were so many parts I did feel quite in control and it at least felt as if I could use many different poses with the figure that normally with an usual drawn up storyboard you don't really think about that much. at least I didn't. Because you just draw some simple manikins on the storyboard and you don't really think about the exact looks of the poses. but here I noticed for example how important it was how the feet were aligned while running which I normally wouldn't think about in a usual storyboard. And also with the backflip you just have to think more about the poses and I think that's kind of good because you do get more knowledge into what you want with the pose and how you can achieve it or if you even can achieve it.

21
00:08:43,140 --> 00:09:02,040

[Interviewer]: Okay and just a couple more on a scale from one to seven how satisfied are you with the results?

22
00:09:02,080 --> 00:10:28,820
[Participant]: I think three to four. I wasn't that satisfied because I used up too much time with some of the poses and therefore had to use less time with the backgrounds which at some points could have needed more time and the more I got into it the better it was but at first. it was quite difficult to get into the flow of setting up the figure then getting the background how I should do the time management exactly. I thought it would be easier at first and that's why I took quite some time with the first few poses and then I realized oh my that was way too much time for just this simple pose. I should move up to the next one and it got better later on. but yeah I used too much time for unnecessary things that especially for a storyboard wouldn't be that necessary the pose doesn't have to be perfect it just has to be rough and good enough so that you can see what it does. but I was a bit too detailed interested and when that didn't work out I tried it more and then time got less and I got kind of into that spiral of it getting just worse.

23
00:10:31,660 --> 00:10:39,120
[Interviewer]: but if you wouldn't have had the time pressure would you have felt like it was taking too long to make the poses?

24
00:10:42,880 --> 00:11:18,040
[Participant]: I don't think so exactly. setting up the pose wasn't all that time consuming. For me what the difficulty at first was was imagining the pose in my head thinking about what exactly does the body when it's running or when it's jumping and how can I convey it into the figure which took some time but I think it gave me more control and more possibilities than that it restricted me.

25
00:11:19,780 --> 00:11:26,060
[Interviewer]: did the mannequin help you imagine the pose? Because you said it was hard to imagine?

26
00:11:26,100 --> 00:12:07,420
[Participant]: I would say so. I did need a combination of kind of doing the pose myself and then conveying it to the figure. but like seeing an actual presentation of a body and how I can move the joints did make it easier especially for something like a backflip which I never did. but it helped me imagine what the body would be capable of and what it would kind of look like

29
00:12:07,680 --> 00:12:09,640

[Interviewer]: Yeah okay you already said you had struggles with the mannequin and placing it. Were there any other challenges you had? Except time also.

30
00:12:09,680 --> 00:13:10,460
[Participant]: What sometimes was a bit difficult was setting up the camera while setting up the figure and sometimes especially with that apparature to keep the figure in the air. it sometimes was difficult to keep it in the right pose while also keeping the camera on the figure and sometimes I had to manage a bit around of holding the camera with my arm and then keeping the figure up while also getting the photo which was kind of difficult at some points and I think that did take up quite some time with the back flip especially with the last frame because I couldn't do all at once but I kind of had to. So I think if it was a bit easier to set the figure up in the air and perhaps have some kind of stativ or something for the camera it wouldn't have been that problematic.

33
00:13:14,340 --> 00:13:22,260
[Interviewer]: Okay thank you that's it for the first interview.

D4p1.2

1
00:00:02,940 --> 00:00:09,240
[Interviewer]: On a scale from one to seven how did you like the physical posing feature? After the last task.

2
00:00:09,280 --> 00:00:39,540
[Participant]: I would put it on a six. I did like just trying out a bit of different things and using various props with the figure and just seeing the results and it was quite interesting. I think there's quite a lot you can do but as I've now noticed also quite some things you have to watch out for to get good results.

3
00:00:56,100 --> 00:00:58,940
[Interviewer]: Did you get any new insights through the last task?

4
00:01:01,360 --> 00:01:58,360
[Participant]: Using props did work better than expected and the AI did get my idea of using the little squares as carton boxes and I was quite satisfied with that and I think using the right prompts you can get quite a lot of good results using additional props especially for probably more complex scenes where there are actually various important things in the scene that you

can probably quite easily set up with some very simple props and use AI for help to get a good overview of the scene.

5
00:01:58,440 --> 00:02:02,160
[Interviewer]: How did you like this addition of the props on a scale from one to seven?

6
00:02:03,020 --> 00:03:00,300
[Participant]: I would put it on a seven. I think it gives you quite a few more options especially for creativity on how you want to set up the scene. It was also quite good to have some kind of reference in the scene in addition to the figure where you could put it in relation which was quite nice and i do see quite a big potential in using various props for scenes. i was also thinking of doing a scene where perhaps the figure was holding something in their hand. um because i think yeah it seems kind of nice in my mind to use props in such ways and if it works with ai which it kind of did in the scenes i think it can be quite nice. actually

7
00:03:00,600 --> 00:03:15,540
[Interviewer]: how did the physical posing influence your creative process?

8
00:03:19,060 --> 00:04:02,620
[Participant]: um in some way i would say it hindered me because i as mentioned before i often couldn't get the exact pose as i wanted. sometimes the one arm worked better than the other and then i had to look around how i'm gonna handle it now which often didn't quite match my expectations. um on the other hand it in a few situations it gave me a few more new ideas because i was like oh i can also do that pose put that arm down there and it gave me a few new references and ideas that i wouldn't have gotten if i just thought about it and put it down on the paper.

9
00:04:02,680 --> 00:04:22,320
[Interviewer]: How did the transition from physical posing to ai-generation feel in your creative process?

10
00:04:22,380 --> 00:05:58,320
[Participant]: I would say that was especially with the creative task one of the more difficult parts because in my mind the scene was quite logical and should work out as i expected it to. but i did have some problems with getting the right prompts and getting the ai to see my vision. and in addition to that in the last two frames there were a bit of problems with the posing things i should have done different so that i actually saw it and could identify what i wanted it to do. and i realized that um hiding out various parts of the body got myself quite some difficulties with the

end results because then imaginary limbs were added or a head was added where that shouldn't be one. and yeah that showed me that there was quite a significance in what the ai can see and what it can't. and i think that you have to think about that quite a bit because you have to change quite a lot of shots for that and yeah i think it can be good but you have to think about your idea in a different way but it can also hinder you quite a lot if you can't set up the shot as you want it because there are just some parts of the body that won't be seen in that shot even though it will get you difficulties with the AI.

11
00:05:58,460 --> 00:06:10,360
[Interviewer]: Were there moments where the mannequin changed your original idea in this last task?

12
00:06:10,400 --> 00:06:45,780
[Participant]: I would say so because i couldnt get one of the arms up to the head so that the hand is touching the head and i therefor put it down towards the legs as if the man was hurt by the jump also on his leg and not just his head which was kind of ok but it just didnt fit quite my vision that I had so yeah it gives you new possibilities but it also may hinder your former ideas.

13
00:06:52,860 --> 00:07:02,020
[Interviewer]: Mhm. And how did the physical interaction influence your creative expression? You already said it hindered you a little bit. Was there anything else?

14
00:07:02,880 --> 00:07:09,600
[Participant]: Could you give me an example?

15
00:07:10,300 --> 00:07:27,100
[Interviewer]: Um, yeah, for example, you wanted to, um, you said that, for example, the props helped you, um, to think of, like, some ideas or something.

16
00:07:27,760 --> 00:08:25,260
[Participant]: Yeah, um, using additional props was quite nice because I could envision where the props would be in relation to the figure? And if the figure interacts with the props, how the next scene would look realistically? Because, um, I wanted him to fall onto a few boxes and then I was thinking, okay, how would these boxes be aligned after the fall? Which was easier with physical props than it would have been in my mind. And I think especially those aspects are quite useful for such use cases with AI and realistic props and setting that up because oftentimes when there are many different objects, perhaps of different forms in a scene, it's

sometimes maybe a bit difficult to imagine all that and how it would logically end up after the scene. And just seeing it in front of you makes it way easier.

17
00:08:27,900 --> 00:08:38,820
[Interviewer]: Mhm. Okay. And did you feel you could express what you thought of through this interaction?

18
00:08:40,740 --> 00:09:33,060
[Participant]: Sort of, yes. On one hand, it was quite nice because I could set up the mannequin, how he would fall, align him exactly how I wanted, get a good shot. On the other hand, I sometimes thought, hmm, I could have also drawn that up and probably done it more in my vision than it ended up in. And I think that's quite a thing I still find a bit problematic because it may be easier to draw it down, but getting a more detailed and realistic shot is kind of easier when you have it all in front of you. And therefore I'm kind of torn between what kind of way I prefer because both have their advantages and disadvantages. Um, yeah.

19
00:09:35,340 --> 00:09:55,580
[Interviewer]: So, um, I'm just gonna say what you said. So, um, you would say, uh, if you do, you draw it, it's like more, um, exactly how you imagined it. And with this, it's just more detailed probably, but not necessarily accurate to what you're imagining.

20
00:09:55,620 --> 00:11:23,320
[Participant]: Exactly. I think I can envision it more if I draw it myself, but it feels more easy to think about how would all these different complex parts interact with each other when I can see it and transform it in real life. Because if I would be thinking about how he would fall and how he would land on the ground after the scene, it would be a bit more difficult for me to envision that in my head and then draw it down. While it here was quite easy to set up the figure, um, how he would fall on the boxes, and then think about what would happen next. So, yeah, I don't know if the combination would be quite a good thing, which I kind of see in the AI if it was more, um, detailed and a bit less wonky at some places, because it would combine the using the use of the realistic and physical props while also getting yourself up and drawing the scene that you may be able to change up a bit with the different prompts you have. So, I. do see quite a bit of potential in using realistic props and physical props and using AI, because it could combine those aspects of having something physical and drawing it up to your own vision.

21
00:11:24,320 --> 00:11:40,360
[Interviewer]: But would you say the AI is necessary at all then? Like, you could also pose everything and then you would have it like for the inspiration of how you can, what you can do with the body and stuff, and then still draw it exactly how you imagine it.

22
00:11:41,040 --> 00:12:24,060
[Participant]: I think it depends on your plans, because what I do like about the AI approach is that you can, that you need way less time, because you set up the shot here, take a quick photo, and then let the AI do its thing. And if it works out, you easily have a perfect shot for a storyboard, while with drawing it takes some more time. Maybe you need to do some readjustments. Perhaps you want a different pose, which always takes up more time if you have to draw it yourself, while with AI you can easily change up a thing or two and then get a whole new shot in a few minutes, compared to tens or twenties of minutes with drawing.

23
00:12:31,680 --> 00:12:44,760
[Interviewer]: Okay, I just have a couple more. On a scale from one to seven, one being the most negative, how much do you feel like the author of the storyboard?

24
00:12:48,380 --> 00:13:39,180
[Participant]: I would put it on a five. Up until the point where the image is generated, I feel pretty much totally in control. Also with writing down the prompts, but yeah, Sometimes the result of the AI works out in my vision, sometimes it didn't. And if it doesn't, it kind of feels difficult because I then have to think about, okay, how can I readjust it so that I get a good result from the AI, without disrupting my vision, which most of the time was quite difficult, because I would have had to change the scene in ways I didn't want it to change. But if it worked out, I did feel as if it was my result, when it worked out well.

25
00:13:43,520 --> 00:14:00,840
[Interviewer]: Did the interaction with the mannequin influence this rating? So you already said the interaction with the mannequin did give you the feeling that you're the author.

26
00:14:00,940 --> 00:14:31,920
[Participant]: Yes, totally. because it did give me quite a lot of control about how I want to set it up, how I want to, how and where I want each limb. And I would say that it gave me quite a lot of control and a feeling as if I did everything there and as if I was the author. So I wouldn't say that it would have given me other feelings beyond that.

27
00:14:33,280 --> 00:15:02,880
[Interviewer]: How would you rate this interaction compared to the traditional storyboarding process? You already said a little bit about this. You said, for example, it's more time consuming to do the traditional process. And to change small things, but also that you could like exactly transfer your vision.

28
00:15:03,240 --> 00:16:59,060
[Participant]: Exactly. So what I especially like about the traditional way is that absolute control that you have about the whole process. Because you have to think about the poses, you have to draw it down, you have to do any minor changes. And you are also able to do that exactly how you envision it. And... I think at the current stage where, for example, the results of the AI were here, I would still prefer the traditional way. Because when I get a mediocre result here, I would have to do a new prompt or do a new generation of the image. And it may get better, but it may also get way worse. And then I'm in that struggle of getting the exact one how I want it. And I can't just go into the image right here. And just erase a few things, add a few things easily. Therefore, it also feels kind of like... As if it's based on luck and chance. If the result is good or not. And that doesn't feel that good for a storyboard at some points. Because a storyboard shouldn't be that extremely detailed. It should just show you your exact idea, how you want it, how you want everything to set up. Which... For a traditional rough storyboard seems kind of ideal, how you are normally doing it. So what I would like for the AI version is some kind of way to edit the results without having to do a whole new generation of the image. Because some of the images were almost as if... Almost how I envisioned them. It were just a few minor details I wanted to change. And with the new generation... That wasn't the case because it was way too different again.

29
00:17:16,940 --> 00:17:25,000
[Interviewer]: Then in comparison, how would you rate the interaction compared to an AI only storyboarding process?

30
00:17:26,960 --> 00:17:28,040
[Participant]: Could you repeat the question?

31
00:17:28,960 --> 00:17:38,880
[Interviewer]: How would you... So you said how you would rate it in comparison to traditional storyboarding. And how would you rate this interaction compared to AI only storyboarding?

32
00:17:40,700 --> 00:17:51,520
[Participant]: So... You mean compared to other generative AI concepts? Or just like how I rate the general concept of generating AI storyboards?

33
00:17:52,760 --> 00:18:03,480
[Interviewer]: I mean compared to... Like if you were to do a storyboard and use some kind of generative AI... How would you find that compared to this?

34
00:18:10,260 --> 00:19:37,180
[Participant]: Hmm... I think it would be fine... Um... What I like here is that mixed media approach. Of having something physical. And from that I generate a result. And that Especially for storyboard seems kind of easier than... Compared to just generating the whole thing without any references. Because then... The possible results are so endless that it's very difficult to get exactly what you want. Um... Even though... It may be easier with generative AI in general. Because you can get pretty detailed with the prompts. But you would also have to look up the exact prompts you want. How you exactly achieve your vision. Because here I can just put up the poses. Um... Worry about the background with the prompts. And then I get a result. While with generative AI... Sometimes you have like 50 or 60 prompts. For an ideal setup. Which... Seems kind of unnecessary for a storyboard in my opinion. And kind of as a time sink you don't really need. Because there are other things you can more focus on. And... That's where I prefer this approach more.

35
00:19:39,140 --> 00:19:58,900
[Interviewer]: Then just two last questions. And do you... So... You already said that you would like to be able to edit the results. So just change a couple of details. Do you have any other suggestions, ideas for the system?

36
00:19:59,480 --> 00:21:31,580
[Participant]: Um... Hmm... I think the main thing would be the editing. I think that would give you some needed control over a few. aspects. And... What I found quite interesting is some of the prompts generated backgrounds with color. Some where you didn't have that. And I think some additional control over that would be kind of nice. Because sometimes you may want a bit of color in the background. Sometimes you don't need it for the storyboard. And I think that would be kind of a nice thing to have in general. Having more options you can choose from. For example, if you want it a bit colored. If you don't want it... If you want it explicitly in black or white. And I haven't really tested it with the prompts. But having some more control about how detailed the backgrounds are would be nice. Because some were enough but very rough. While others were detailed with intricate trees where you could see every branch. Mm-hmm. And... Having some more control about that would be kind of nice. Because sometimes it was a bit too distracting. Sometimes it was a bit lacking. Because it were just a few lines. And having a bit more control about such aspects would be quite helpful, I think.

37
00:21:33,660 --> 00:21:36,100
[Interviewer]: Okay. Do you have any other remarks?

38
00:21:39,780 --> 00:22:54,940

[Participant]: I don't think so, no. I like the idea of using AI for something like that. Because in such a case, AI doesn't do the whole work for you. It just assists you in one aspect. And you still have to do all the poses, the thinking, describing the background. And that approach of AI, I think, can be quite helpful. Especially if it's a bit more developed, this whole concept of generating AI storyboards. Because with generative AI, I think that's also a bit problematic if you don't have that much control about the result. And it just feels as if you put something into the AI and it throws something out. And you're just fine with that. And I think the approach that's more needed for AI is something where we cooperate with AI. Like here, where we do that approach of posing. And then helping it with AI. And perhaps saving a lot of time with storyboarding. And that's why I quite like that approach. Especially if it's more developed and more refined.

39
00:22:57,240 --> 00:23:14,300
[Interviewer]: Thanks so much.
