D4p2

1
00:00:04,380 --> 00:00:07,740
[Interviewer]: Okay, um, so how did you proceed with the first task?

2
00:00:07,780 --> 00:00:17,520
[Participant]: Um, okay, what was the first task? The first task was to recreate the scene, the frame, right? In the genre?

3
00:00:18,280 --> 00:00:22,540
[Interviewer]: The one where it was separated into two frames already with the shots.

4
00:00:25,440 --> 00:01:39,120
[Participant]: So I think it was clear for me, at least. There was not too much information which made it easy to to proceed with the task fast. Also, it was saying, which arm to show to the camera? and this way I decided in which way Dave would run so that he would run from the right to the left so that the left arm could grasp the camera. and yeah well I was then thinking what pose I could do and which was quite clear. I was just thinking of the running pose. and well yeah I think because still the the the information was quite clear. that he would look ahead and the arm would grasp the camera was for me yeah clear. so I just did that.

5
00:01:42,060 --> 00:01:51,800
[Interviewer]: and in the second task how did you proceed?
6
00:01:54,180 --> 00:03:24,000
[Participant]: so I would say I was struggling a bit because it's like a bigger movement. so doing jumping up and then making a back flip I did struggle a bit to think about what I would like to show in the way that it's clear that he jumps up and that he does the back flip when he has his knees towards his chest. I think if I would have had more time maybe I would have found a way to show it more clearer. because yeah I think at the beginning I was very much into the detail. so you know going down and then going up and then the backflip which is technically most of the movement or where happens most of the movement there's just this one frame where he's like this in the air. so that was a bit harder I would say. but I think so that he jumps up it's clear I like that. but yeah I think maybe I could have changed some frames so that it's even fewer that he makes the backflip in. that there's not so much focus on the first two frames.

7
00:03:24,080 --> 00:03:49,760

[Interviewer]: so when you proceeded you started with the drawing and then you did the pose. did you think about exactly how you wanted to do the separate frames or did you come up with new ideas while you were using the puppet?

8
00:03:49,940 --> 00:05:27,680
[Participant]: So I would say for the first the first frame was clear. so I had the idea I sketched it down I did the pose I did not think so much about the next frames while I was doing the first frame and then at the second frame where I was I didn't decide yet or I hadn't decided if I wanted him to be like in the air or or like. I knew I wanted him to be in the air stretched out but I wasn't sure yet that I wanted to do this kind of shot where you would just see his feet. but that was more like a creative thought I had while I saw him here and yeah then I just decided for that. and so yeah that was like more spontaneous and then which I also sketched down the third frame where I also wrote halbe Drehung. I guess that was also where I kind of freestyled a little bit because I didn't know how well I could make the pose and because I also knew that I'm quite sure in 10 minutes I will not be able to go so much further than I would have if I had more time. So yeah, I just tried to make some sort of backflip pose as best as I could and I think I was limited or also creatively limited in well the things Dave could do which ended up in this.

9
00:05:28,580 --> 00:05:41,960
[Interviewer]: Okay. So on a scale from 1 to 7, with 1 being the most negative and 7 positive, how did you like the physical posing feature?

10
00:05:43,520 --> 00:05:46,360
[Participant]: I would say I... wait okay. 6.

11
00:05:52,720 --> 00:05:55,380
[Interviewer]: Because? Yeah.

12
00:05:55,460 --> 00:08:12,780
[Participant]: So I like the figure, I think it's very nice, it has a lot of ...gelenke? Yeah. So you can do a lot with it and I think also in a way that I see this as like anatomy reference sort of thing, I really like it because you can do a lot of things. I think especially if you have a better hang of it, like. I would also say that after the first and the second I am getting more used to it and this makes it easier because at the beginning it you you don't know where are the limits of the figure, so you have to find that out, and but after using it more I think it gets easier. Also of course you know the limits and you can work with that but also of course the arms fall out. Or the legs, and that's... Okay. Just you. know with the time limit and everything. Yeah. But I do like the figure, and I think you can do a lot of stuff with it and you can. Yeah. Get creative with it. Yeah. So like for the second frame where I had the figure standing right here and then I had

like a visual reference for a shot and could choose to do something else than I had anticipated, I think that's quite nice of a feature.

[Interviewer]: So you mean that you spontaneously could do with the camera another shot right?

[Participant]: Exactly, so because I have like this 3D figure standing right in the box which I think gives a lot of inspiration in a way. I was also then thinking while doing it that I could have also done it like the other way for example that he would be sideways or just not completely frontal. Which... Yeah I think I had the idea mostly because of the figure and because it was like this set up and yeah.

13
00:08:17,780 --> 00:08:28,360
[Interviewer]: And were there moments where the mannequin changed your original idea? Like you said the shots were for example you changed, was there anything else?

14
00:08:31,880 --> 00:10:27,280
[Participant]: So. I think I mean I think if you think of the ways that you could come up with a storyboard it's you know you draw it directly down or you have like already a reference. Or I don't know you film yourself or something like that. I think having this figure does help with playing around either if it's in the shot. Like yeah if it's a like close-up or... something like that. you can play around with the camera and the figure and directly see like your vision or if maybe something else is maybe even better to transport what you want to show and i think that's nice because you have it is in a way maybe quicker. um i could also imagine of course that maybe you um not directly a distraction because i think if you have like a direct vision you just go with it but you can play around more more quickly with it and i like that. um. so i think if it well yeah i mean you have the anatomical limitations but i mean it's Dave and it's not like some sort of alien so i mean it's a bit of a. it's it's fair and it's good. um and yeah i think it helps. of course also you know i think with more practice of like moving the arms and everything it can get better. so at the beginning it's of course a limitation more than it is of …but um i think it can help yeah come up with the vision and also like play around with poses.

15
00:10:29,000 --> 00:10:38,180
[Interviewer]: On a scale from one to seven how much did you feel in control of the results?

16
00:10:38,640 --> 00:12:45,160
[Participant]: um i would say four and a half to five maybe um i mean um you do have to think about the tools you have because you cannot of course tell the program that dave should be i don't know looking fast or something so you have to come up with the idea. okay how will you show that he's running fast and then you have to work with the background and the pose? so these are the tools that you have of course and um yeah so that's what you're talking about. um

and i think you can. again with more practice and more getting to know the tool i think it's quite clear what the tool can do and um how you can work with it. um but for me i'm a bit slow sometimes and into details and stuff. but also with the storyboard you don't want too much detail. so it's clear that this is in a way enough. Because you can show and you can see that there is a city skyline for example and the program shows you that most of the time because of course for the first frame the city skyline is not completely there. so I would have regenerated that to make this clearer. But I'm not sure how much more into detail I can get. I would have to try it out more. to see how much in control I can get really. But for the things you want to do I think, so storyboard I think it's quite fine of the control that you have.

19
00:12:46,560 --> 00:12:52,040
[Interviewer]: So you would say like the background isn't in detail like you would imagine it?

20
00:12:52,860 --> 00:13:32,440
[Participant]: So I think in my mind I had another picture but I think I could maybe with another prompt or more yeah a better prompt maybe change that to something of something I was thinking of but I just was too slow or I'm too slow so there's that's something I would have to think more and think differently because if I can just draw it down if I have the vision but here I don't draw it down. I have to think of the prompt that would fit this scene I have in mind. And I think yeah the control depends on how good you can translate your vision into a prompt.

21
00:13:33,200 --> 00:13:34,720
[Interviewer]: Yeah exactly.

22
00:13:36,920 --> 00:13:37,800
[Participant]: And I'm bad at that.

23
00:13:37,900 --> 00:13:49,440
[Interviewer]: Yeah me too this is why this came to life. How did the mannequin influence this writing like this feeling of control?

24
00:13:52,260 --> 00:15:10,520
[Participant]: I think in a positive way. More than a bad. way because there are so many joints. I mean in the feet and the hand and everything. you can change a lot. I think you can express things with that. I mean it's not like something emotional or yeah but I would also have to think of course. I think what would help me is. Just like with everything else to see somebody jump to really know how it looks how to jump. because now this is just from my imagination and I think it's not Dave's fault if the jumping and the backflip doesn't look quite right. I think you can

do a lot with it but that also I have a limit of knowledge in like movement and stuff. so I do think you can get better results with Dave if you know better what you are doing. So yeah no I personally have or had fun yeah moving him around and looking what I can do with him.

25
00:15:12,140 --> 00:15:18,840
[Interviewer]: Alright on a scale from one to seven how satisfied are you with the result?

26
00:15:20,160 --> 00:17:36,200
[Participant]: Okay so I think like something between five and six if I had to choose which I have to do. Maybe five but like five plus. I think so of course I was a bit excited you know it does feel a bit like like an exam or something. Which it's not. but you want to try your best and you don't really know what is going to happen. so I mean you're just thrown into this exercise and this task and I would say I think I mean if I look at the results it's fine. I think you can sort of see kind of. it looks like he's falling. I get that. so it's not perfect. I think you can. I could do something better now with the experience that I have. So because yeah he still looks a bit tollpatschig um yeah just doesn't really know where to put his arm and it looks a bit off in a way and like I said I could have come up with better prompts. that would have helped with my vision also just the script. So yeah. So um I think that could have been better. um but I am kind of happy that the time limitation or that with the time limitation I still managed to do something because. I am slow and a lot into details and stuff. and um I mean I have something and there is something I think you could get the idea that he's jumping up and then maybe doing like a sort of controlled backflip situation. Um so I like that. but yeah I think it could have been better. definitely I still see some things that are that could be better. in the pose and the prompts.

27
00:17:37,740 --> 00:17:48,260
[Interviewer]: With the pose you said it looks a little bit off like he's falling. would you say that's because of how you posed the mannequin or how the AI interpreted it or a combination?

28
00:17:48,680 --> 00:18:42,200
[Participant]: I think it's a combination but mostly um the pose. so I think the pose was translated good into the the AI or the program. it read it well but um also because at the beginning like I said I wasn't sure which frames I would use. so I was still thinking and then I did the first two and then I had to do like one frame for the whole backflip situation and I cannot do a backflip. so my like visual library of backflips is limited. so I mean I know that it's like some situation of this. And now that I look at it I think the arms could have done something better. um but I do think it's more my fault than it is Dave's.

29
00:18:42,240 --> 00:18:52,400

[Interviewer]: Okay and then just one last question. Did you face any challenges? you said like imagining the arms? Did you face any challenges? you said like imagining the arms? Did you face any challenges? you said like imagining the arms? Did you face any challenges? you said like imagining the arms? you already said imaging the backflip the limits of the puppet. Was there anything else?

31
00:18:53,700 --> 00:20:10,740
[Participant]: um well yeah coming up with prompts like better fitting prompts because my prompts were very I think like the words just come directly from the script and I think that could have been better definitely um which could have given it like. I don't really know yet the limitations of this specific AI tool um. but I do think that with better prompts I could have gotten better results and um. so I think it was again my limit of coming up with good prompts in a way um because well yeah the script was clear um but yeah I don't know it's not very consistent and not very uh yeah like I imagined well and so I think that was yeah something that was holding me from getting the best and um yeah the time maybe but yes of course I understand that.

33
00:20:11,940 --> 00:20:14,800
[Interviewer]: so uh you said not consistent. you meant the background right?

34
00:20:14,880 --> 00:20:34,020
[Participant]: yeah I meant the background. so I think Dave is quite like. I think he's wearing shorts in one frame but I mean I didn't notice until now. really. so that's not too much of an issue in my opinion.

35
00:20:35,760 --> 00:20:42,440
[Interviewer]: all right then that's the first interview.

D4p2.2

1
00:00:01,020 --> 00:00:06,100
[Interviewer]: On a scale from 1-7, how did you like the physical posing feature in the in der letzten Aufgabe

2
00:00:27,060 --> 00:01:22,760
[Participant]: five, I personally like to have something in my hands so to really physically touch something and I personally do get a lot of inspiration I would say with like having this figure or just in general things in my hand looking at them and yeah playing around with it. so I would say I like that. I do think though that with everything falling apart it does get a bit frustrating and

there are then more limitations than you would think initially. so yes I would say I like it but yeah.

3
00:01:30,520 --> 00:01:34,940
[Interviewer]: Did you get any new insights through the last task?

4
00:01:35,920 --> 00:02:44,820
[Participant]: Yeah. Yes I mean I did try some new things with the other figure and I would also say that some things I mean I did at the beginning did not even really see because sometimes the AI does something and you don't really know why until you understand why and I did understand that it was beginning to also see those the Stäbe and I do think that I was going somewhere. it was getting good until the very last frame which was a bit too much maybe. and yes I did see some new things then and learned some new things about the tool and the figures. And how it translates into the program.

5
00:02:44,860 --> 00:02:48,740
[Interviewer]: On a scale from one to seven how did you like the addition of the props?

6
00:02:48,800 -->
[Participant]: Um seven. So I think I mean I didn't have to use them right and um the only negative which isnt really a negative but of course you get like much more possibilities and then for me personally um sometimes when I have too much possibilities and too many things I could do that I just freeze um. but I would also say that I did manage to decide quite quickly that I will use like just this other figure and um that. I had then a clear way of course there were some problems then when I also used the other figure, but in general I think it's quite fun to play around with props and yeah.

9
00:04:00,680 --> 00:04:05,680
[Interviewer]: And how did the physical posing influence your creative process?

10
00:04:11,340 --> 00:05:56,460
[Participant]: I mean you can put more thought or like humanize this figure. I think while posing and sometimes you while you are on the way to change the figure into a pose you just sometimes have like some other micro poses you see which can give one more ideas. And yeah that's I like that and also the way you can interact with props. that's also something I really appreciate. And I think it's quite a nice feature. Yeah so the physical posing did give room for more ideas and you cannot of course change the the face, the mimic which is more well if you want to show a specific vibe or a feeling can be of a burden more because Dave he looks like

he's doing an advertisement for Nike or something. But yeah I think other than that it's cool and I like it. But the face can be a bit of throwing but.

11
00:05:59,680 --> 00:06:07,740
[Interviewer]: Okay and how did the transition from physical posing to AI generation feel in your creative process?

12
00:06:09,780 --> 00:08:24,200
[Participant]: I personally think it was exciting. so because there's just something happening and you just you press the button and then you wait and then something will come out and you don't know yet what it is. I think it's interesting I like it. And can of course. I think there it can go both ways either it in a positive way does really what you want which wouldn't. I wouldn't say that this is the normal case. I would say very often there's just like a slight difference or like really big difference of what you were thinking would come out of it and there there's just something completely else. but you can normally work with it. I would say also the third frame for example which was when I first generated it it just was completely out of my what I was expecting but I was able to work with it and change it and there is no dog anymore and only one person has three legs. There is a lot of room for improvement if something is not the way I like. Either way if it comes out good or bad you can work with it. Maybe sometimes it's you know something that's rather frustrating if you really dont get where you want, because I think you cant do everything with it there are limitations. But overall I think its nice and I like this. it's a cooperation so you have to work with the program and think and see what you can do with it because yeah it will do something of its own of course but if you know how to handle it it can be very powerful.

13
00:08:24,520 --> 00:08:39,460
[Interviewer]: Were there moments where the mannequin changed your original idea in this last task?

14
00:08:39,500 --> 00:10:37,620
[Participant]: yes maybe so for example…So one thing was I was anticipating for the second frame that only the hand would show from the second figure, but in order for the AI to really recognize the figure I had to put or I well I didn't test it out but I put more of the figure into the frame so that it will recognize it. so that was a change I. would say. Also the way it was kneeling down. I think I had another vision in a way but also not so clearly. So I was figuring it out on the way while making like the legs so that the figure could like kneel down and just stay there. That was like also a cooperation with the figure. so see okay how can you do this how can you just stay there? and so that the scene can just be like this? and also when I was doing like the first sitting pose I was thinking of doing like more that he would have his knee like on his

chest. but that's was too complex. so I just left it like that. that was also a change but I now also like it I would say and yeah so these were some changes

17
00:10:37,700 --> 00:10:40,700
[Interviewer]: So you know like also the figuring out with the pose with the kneeling it was because of the restrictions of the mannequin?

18
00:10:41,720 --> 00:11:22,140
[Participant]: no I would say like restrictions that I felt were more for the first sitting pose from Dave really and for the second figure I think it was more of a positive way that I could like see and experiment how it would look like and how it could kneel down in a good way. so yeah I would say that was more of a rather beneficial limitation. or just um trying and playing around and here I had I felt the limitation of the figure

19
00:11:22,660 --> 00:11:28,400
[Interviewer]: um how did the physical interaction influence your creative expression?

20
00:11:28,820 --> 00:13:23,140
[Participant]: um I would say um I think I was able to see more. um or more varieties of like something similar faster. so for example if there was a pose I could for example turn it around or just move one arm and then just um I had like already a variety of options just with this one pose and this one figure. um by just turning it around and looking at it the other way and just moving like small things and also um just yeah like the figure interacting with other figures or just other props which I would say I mean I just have the other figure but I think you can come up with cool ways of incorporating your figure into other things. I personally really like this miniature figure and then just having like, I mean, it's in, I guess, our world in a way and then just moving it around and getting ideas from that. I mean, I didn't do that because, yeah, but I do think that, or I really like this physical interaction with props and other things and being able to see, yeah, varieties of this, just the same shot, but or the same frame with small changes.

21
00:13:26,800 --> 00:13:36,860
[Interviewer]: And just a couple of more questions. On a scale from one to seven, how much do you feel like the author of the storyboard?

22
00:13:38,200 --> 00:15:30,080
[Participant]: Um, maybe, maybe also a five because the poses did translate into the program and I was also getting more a hang of it. But at the same time, I'm not completely satisfied with the results. I do think I could get more out of it if I would just like, yeah, use it more and just play around more with it and see what I can do. But also, of course, there is a lot of input the AI sort

of does or puts in it in its own way. Like, for example, it does give like Shoe advertisement and I was thinking of like some melancholic night scene, which, of course, I mean, makes sense that there is not this hardly melancholic romantic scene going on just with this one frame and just with him sitting down and my prompt being moon in the sky and close up city skyline. So, I mean, I am the author. Definitely. And I did produce that, but it's not really my vision. And I. but I do think that there's a lot of room for improvement. Just working more with it.

23
00:15:30,120 --> 00:15:39,880
[Interviewer]: Okay. So how did the mannequin influence this feeling of authorship? So you said The poses translated well to the program.

24
00:15:44,020 --> 00:17:20,579
[Participant]: So I think, yeah, the poses translated well. And sometimes you can you when I was like taking a picture and the picture was generated in the program. It did look off sometimes. But when I would look back at the pose I would understand why. So it's not like the AI is mostly not just taking something from nothing. I mean, yeah, a lot of things the AI does make a lot of sense because the arm is like that. And that implies a certain movement or a certain way which I don't directly see in the figure. But then I can see in the picture where like Dave is fully Dave. And so I do think I mean, I had limitations with like legs falling and everything. So that made it a bit harder to really make the figure do what I want. But overall, I think that yeah, I made that I can see that and yeah, I resonate with it. So yeah.

25
00:17:24,619 --> 00:17:29,240
[Interviewer]: And how would you rate this interaction compared to traditional story?

26
00:17:29,580 --> 00:19:18,840
[Participant]: I think it's very cool. I think it I mean, I'm not like that deep into I don't know what tools people use in the world to storyboard. But for me, it feels like innovative, you know, and I really like it. And I think you can do a lot of things with it. And it's also a way to just come up fast with a storyboard or a certain frames. And also, I think if you would also you could also use this just for as a base, for example. So use this and then also add some things or change some things digitally and just draw over it or something like that. I think for that it would be very, very good. And just itself the way it is right now. I think there are some flaws in a way that would rather. Yeah, like not directly stop the flow, but yeah, something like that. But I really like it and I think it's a very cool tool. Like I'm a fan. I think it's really cool to have like this little box and yeah, just these figures and prompts. And I think it's a very cool idea. And yeah, like I said, if I think I would personally, for example, I think I could imagine using this with like I said, changing some things up then by hand and drawing or something like that.

27

00:19:20,560 --> 00:19:29,800
[Interviewer]: How would you rate this interaction compared to an AI only storyboarding process?

28
00:19:32,060 --> 00:21:20,940
[Participant]: Better because you of course have, I mean, AI only would be then just giving like just having a script and then letting the AI do everything right? No, I think this is way better because you obviously have single frames and I think like the more AI has… Like the less you interfere in the process of making something. rather it's a storyboard or something else. I think the AI might lose, of course, your own vision. So it does things of its own in a way. And the less you interfere in those little steps, like how many frames or what is in the frame or background prompts and pose and everything and things get lost. So that's why I think this is very cool because you do have more control while still using or still having. lots of benefits from the AI. Just making the figure a full on human doing a pose and having a background. And I mean, I do see a scene. Sort of. And I also see like what I did. And yeah, that's why I think this is for this task. Yeah, very cool because you interfere more and I think that helps a lot with making your vision real. or yeah.

29
00:21:22,260 --> 00:21:28,240
[Interviewer]: And even if you like where given and then giving the AI prompts to generate each frame.

30
00:21:28,960 --> 00:22:44,020
[Participant]: Mm hmm. Yeah, I understand. But I think it's easier to change the figure physically then. I mean, I'm sure there are people who can give prompts to an AI and then really get what they want and really change maybe small details to really what they think. But I think this might be better for like a broader. Yeah, just for more people. Because like I said, I am shit at doing these prompts. And so this helps a lot. Just being able to because I also really like doing like drawing and painting and sculpting and things like that. So this is a very cool way of using the AI while not just typing, but also doing physically like moving the arm and using promptss and everything. And I think a lot of people who don't use AI a lot might really benefit from this way of working with it.

31
00:22:48,120 --> 00:22:57,040
[Interviewer]: OK, then just two more things? Do you have any suggestions or ideas for the system?

34
00:23:04,980 --> 00:26:06,800

[Participant]: Okay, let me think. So, yeah, what was in my mind of course was just in general using this as a in-between step again and then going over it again manually. Because, yeah, of course I think, like I said, the face for example is still a thing. I mean, I think what could be nice, I don't know, maybe a detailed step where you can like give, like first let the scene do what it does here and then maybe go over the frame and then change the face or something to be like, okay, he's looking sad or he's looking happy or something like that. I think that could already change a lot from just, yeah, being the same face everywhere. And also So... Yeah, I don't know. with the figure of course it would be nice if the legs don't always fall off and everything. And I don't know about colors and stuff. I mean, that would be something that I would maybe at some points, I mean, it's not necessary for every frame of course, but for me colors do play a big role. And yeah, maybe just, I don't know, to sort of incorporate colors in some way. Maybe manually give like from one scene color something in just very roughly. And then if it could just like put this over all of the frames in the scene, for example, or something like that. And yeah, yeah, maybe like in the physical form, because the way it is right now, sometimes like these things get also into the frame. And I don't know, having some other thing where you can put the figure in or something. But that's of course more, yeah, just more. Yeah, that would be the things that I would just get right now. I mean, I'm sure if I would think more about it, there would be maybe other things. But right now, that's just the only thing.

35
00:26:08,200 --> 00:26:12,560
[Interviewer]: Okay, do you have any other remarks or thoughts?

36
00:26:16,640 --> 00:26:33,160
[Participant]: I think I said everything. I mean, like in general, I think this is super cool. Very nice idea. And yeah, just very cool tool to make a storyboard with. So yeah, I'm impressed.

37
00:26:34,740 --> 00:26:39,520
[Interviewer]: Okay, thank you so much.
